

BUILDING OF FIRST PHYLOGENETIC TREE

using the same insulin protein alignment from Day 5.

Species:

- Human
- Chimpanzee
- Mouse
- Cow
- Zebrafish

INTERPRETING THE RESULTS

- **Human & Chimpanzee** - They share the most recent common ancestor. Their insulin proteins are expected to be highly similar.
- **Mouse** - Still a mammal, but more distant than chimpanzees.
- **Cow** - Related to humans as a mammal but on a different evolutionary branch.
- **Zebrafish** - The most distant among this group. Its insulin sequence should show more differences.
